

**blocks the acid
that causes frequent
heartburn.**

Only one tablet every 24 hours, for a 14-day treatment.

Why should I take OLEX™?

OLEX™ is the first non-prescription proton pump inhibitor (PPI) specifically approved for frequent heartburn (2 or more days a week) in Canada. This next generation treatment means that with one pill a day, you can reduce the acid that causes frequent heartburn.

How does OLEX™ work?

OLEX™ is a medication that works differently from other non-prescription heartburn products, such as antacids and other acid reducers. This next generation treatment stops acid production at the source by directly acting on the stomach acid pump.

OLEX™ will start to suppress acid within a few hours but is not intended to give instant relief. Even though you may feel heartburn relief in the first few days, we recommend taking the entire 14-day treatment to relieve your frequent heartburn. You should wait at least 4 months before taking another 14-day course of treatment.

Does OLEX™ work immediately?

OLEX™ starts to work on the very first day of treatment. Some people get complete relief of symptoms within 24 hours; however, you may have to take OLEX™ for 3 to 5 days to feel the full effect.

When should I take OLEX™?

OLEX™ should be taken once a day with a glass of water and before eating in the morning for a period of 14 days. A missed dose may be taken within 12 hours of the scheduled time. If more than 12 hours have passed, skip it and just take your next dose on time.

When should I talk to my doctor?

If you don't feel relief after your 14-day treatment, if you experience severe and/or persistent diarrhea or if you need to take more than 1 course of treatment within a 4-month period, you should talk to your doctor. (For complete information, please refer to the Consumer Information that you'll find in your OLEX™ box.)
